1. (10 points) Fibonacci sequence. If you put some coefficients in the recursion, like  $r_{i+1} = ar_i + br_{i-1}$ , where you choose the numbers  $a$  and  $b$ , then you will have an entirely new sequence. Write a function that takes  $a$ ,  $b$  and the sequence length  $n$  as arguments. The function should return the entire sequence. Choose appropriate input arguments and plot the returned sequence.

```
r <- function(a, b, n) {  
  # start with i = 1 and i-1 = 0  
  i <- 0; r1 <- 0; r2 <- 1  
  while (i < n) {  
    print(r1)  
    r3 <- a * r2 + b * r1  
    # update values  
    i <- i + 1  
    r1 <- r2  
    r2 <- r3  
  }  
}  
# Choose a = 1, b = 1, n = 10  
r(1, 1, 10)
```

```
## [1] 0  
## [1] 1  
## [1] 1  
## [1] 2  
## [1] 3  
## [1] 5  
## [1] 8  
## [1] 13  
## [1] 21  
## [1] 34
```

2. (20 points) 0-1 knapsack problem. Given a set of items, each with a weight and a value, determine which items to include in the collection so that the total weight is less than or equal to a given limit and the total value is as large as possible. Mathematically, given a set of  $n$  items numbered from 1 up to  $n$ , each with a weight  $w_i$  and a value  $v_i$ , along with a maximum weight capacity  $W$  (assumed to be an integer), the 0-1 knapsack problem aims to solve the following optimization problem:

```
wt <- c(10, 20, 30)  
vt <- c(60, 100, 120)  
w <- 50  
n <- length(wt)
```

```

M <- matrix(0, nrow = n + 1, ncol = w)
k <- function(x) {x + 1}

# function
Knapsack <- function(weight, value, capacity) {
  # to skip the first row, start with 2 to k(n)
  for (i in 2:k(n)) {
    for (j in 1:w) {
      # if the weight of new item is over j-th, use the value at {(i-1), j}
      if (j < wt[i - 1]) {
        M[i, j] <- M[i - 1, j]
      }
      # ifelse, comparing m[i-1,w] & m[i-1,w-wi]+v and pick the bigger one
      else {
        M[i, j] <- max(M[i - 1, j], M[i - 1, j - wt[i - 1]] + vt[i - 1])
      }
    }
  }
  return(M)
}

# wt = {10,20,30}, vt = {60,100,120} and W = 50
M <- Knapsack(wt, vt, w)
# change the row names
rownames(M) <- 0:3

```

M
